CONTRACT ADDRESS → AI TOOLS

ORLOJ STELLAR

Hack Meridian / 2026 LISBON | GUAVA® Stellar

PITCH STEP 01 / 04

THE PROBLEM

Every contract needs another custom AI integration.

- Translate contract interfaces into usable tools.
- Connect a wallet and define what the agent can do.
- Track transaction results beyond the conversation.

One contract address. Typed MCP tools. Explicit permissions.

PITCH STEP 02 / 04

THE SOLUTION

Register. Authorize. Interact through chat.

- Extract the deployed interface and expose supported methods.
- Use PageBook in chat to inspect markets and request a quote.

This browser demo is quote-only. No new transaction submitted.

PITCH STEP 03 / 04

HOW IT WORKS

Deployed WASM → contract specification → typed MCP tools

- Validate arguments and enforce explicit execution policy.
- Reads simulate; writes use a separate signer and tracked receipts.

The model never receives the wallet's private key.

PITCH STEP 04 / 04

NEXT: MAINNET

From verified reads and Testnet writes to a scoped pilot.

- Validate owner-approved Mainnet writes end to end.
- Expand protocol coverage, testing and security review.
- Built on Gianfranco Bazzani’s Orloj registry.
